Hsieh M; Lam H, Coruzzi GM,

AAF58583. WPI; 2001-158572/16 N-PSDB; AAF58581, A Novel P-PII genes capable of regulating plant nitrogen assimilation, useful for transgenic plant production, and as probes for isolating additional genomic clones having P-PII gene promoters.

Claim 1; Fig 1; 35pp; English.

The present sequence is encoded by a nitrogen regulatory PII gene. Novel plant PII (also called P-PII) nucleotide sequences have been isolated. They are useful for regulating nitrogen assimilation in plants, and in transgenic plant production. They are also used to engineer organisms that overexpress wild-type or mutant P-PII regulatory proteins. P-PII proteins are useful for in vitro screening of herbicides. P-PII nucleotides may be used as probes for isolating additional genomic clones with the promoters of P-PII genes. P-PII promoters are light- and/or sucrose-inducible, and are suitable for genetic engineering of plants

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present sequence is encoded by a nitrogen regulatory PII gene. Nove plant PII (also called P-PII) nucleotide sequences have been isolated. They are useful for regulating nitrogen assimilation in plants, and in transgenic plant production. They are also used to engineer organisms that overexpress wild-type or mutant P-PII regulatory proteins. P-PII proteins are useful for in vitro screening of herbicides. P-PII nucleotides may be used as probes for isolating additional genomic clowith the promoters of P-PII genes. P-PII promoters are light- and/or sucrose-inducible, and are suitable for genetic engineering of plants
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            KVEAIVRPHRIQQVSSALLKIGIRGVTVSDVRGFGAQGGSTERHGGSEFSEDKFVAKVKM

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               gene. Novisolated.
                                                                                                                         The present sequence is encoded by a nitrogen regulatory PII gene. Nor plant PII (also called P-PII) nucleotide sequences have been isolated. They are useful for regulating nitrogen assimilation in plants, and intransgenic plant production. They are also used to engineer organisms that overexpress wild-type or mutant P-PII regulatory proteins. P-PII proteins are useful for in vitro screening of herbicides. P-PII nucleotides may be used as probes for isolating additional genomic clowith the promoters of P-PII genes. P-PII promoters are light- and/or sucrose-inducible, and are suitable for genetic engineering of plants. (Updated on 11-SEP-2003 to standardise OS field)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         70
                                                                                                                                                                                                                                                                                                                 The present invention relates to proteins from Neisseria gonorrhoeae. Also disclosed are the nucleic acid molecules encoding the proteins and antibodies that specifically bind to the proteins. The composition comprising the protein, nucleic acid or antibody is useful for the manufacture of a medicament for treating or preventing N. gonorrhoeae infection, this may be in the form of a vaccine or gene therapy. Sequences given in records ABP76736-ABP81046 represent nucleic acid molecules of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            KVEAIVRPWRIQQVSSALLKIGIRGVTVSDVRGFGAQGGSTERHGGSBFSEDKFVAKVKM

Novel plant PII (also called P-PII) nucleotide sequences have been isolated. They are useful for regulating nitrogen assimilation in plants, and in transgenic plant production. They are also used to engineer organisms that overexpress wild-type or mutant P-PII regulatory proteins. P-PII proteins are useful for in vitro screening of herbicides. P-PII nucleotides may be used as probes for isolating additional genomic clones with the promoters of P-PII genes. P-PII promoters are light- and/or sucrose-inducible, and are suitable for genetic engineering of plants
transgenic plant production. They are also used to engineer organisms that overexpress wild-type or mutant P-PII regulatory proteins. P-PII proteins are useful for in vitro screening of herbicides. sequences from the Coryneform bacterium Corynebacterium glutamicum. These are useful for identifying the mutation point of a gene derived from a mutant of coryneform bacterium, measuring expression amount and analysing the expression profile or expression pattern of a gene derived from Coryneform bacterium, and identifying a homologue of a gene derived from coryneform bacterium. Coryneform bacteria are useful for producing amino acids, nucleic acids, vitamins, saccharides and organic acids, particularly L-lysine. The present sequence is a protein described in the exemplification of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from the European Patent Office
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              63

                                                                                                                                                                                                                                                                                                                                The present sequence is encoded by a nitrogen regulatory PII gene. Nove plant PII (also called P-PII) nucleotide sequences have been isolated. They are useful for regulating nitrogen assimilation in plants, and in transgenic plant production. They are also used to engineer organisms that overexpress wild-type or mutant P-PII regulatory proteins. P-PII proteins are useful for in vitro screening of herbicides. P-PII nucleotides may be used as probes for isolating additional genomic clonwith the promoters of P-PII genes. P-PII promoters are light- and/or sucrose-inducible, and are suitable for genetic engineering of plants

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The A. baumannii nucleic acids and polypeptides are useful as reagents for diagnosing a bacterial disease, as components of antibacterial vaccines, as targets for antibacterial drugs, to detect the presence of A. baumannii and other Acinetobacter species in a sample, in screening compounds for the ability to interfere with the A. baumannii life cycle or to inhibit A. baumannii infection, and as biocontrol agents for plants. The present sequence represents the amino acid sequence of an A.

                                                                                                                                                                             e. Novel
                                                                                                                                                                                                   and in
                                                                                                                                                                        The present sequence is encoded by a nitrogen regulatory PII gene. Nor plant PII (also called P-PII) nucleotide sequences have been isolated. They are useful for regulating nitrogen assimilation in plants, and in transgenic plant production. They are also used to engineer organisms that overexpress wild-type or mutant P-PII regulatory proteins. P-PII proteins are useful for in vitro screening of herbicides. P-PII nucleotides may be used as probes for isolating additional genomic clawith the promoters of P-PII genes. P-PII promoters are light- and/or sucrose-inducible, and are suitable for genetic engineering of plants

The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed crivity of (II) or to treat disease states involving (II). (II) is useful in gene therapy techniques to restore normal crivity of (III) or to treat disease states involving (II). (II) as polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders of sites expressing (II). (I) and (II) are useful for treating disorders of sites expressing (II). (I) and (II) are useful for treating disorders of involving aberrant protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in the produce other types of data and products dependent on DNA and amino acid sequences of the invention. Note: The sequence data for this patent did not appear in the printed specification, but was obtained in electronic format directly from WIPO at the sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          110

                                  The present sequence is encoded by a nitrogen regulatory PII gene. Nor plant PII (also called P-PII) nucleotide sequences have been isolated. They are useful for regulating nitrogen assimilation in plants, and in transgenic plant production. They are also used to engineer organisms that overexpress wild-type or mutant P-PII regulatory proteins. P-PII proteins are useful for in vitro screening of herbicides. P-PII nucleotides may be used as probes for isolating additional genomic clawith the promoters of P-PII genes. P-PII promoters are light- and/or sucrose-inducible, and are suitable for genetic engineering of plants

AAF71138 to AAF71357 encode the Corynebacterium glutamicum homeostasis
and adaptation (HA) proteins given in AAB79023 to AAB79242. The C.
glutamicum HA genes (1) can be used in vectors for expression in host
cells and production of fine chemicals, such as, an organic acid,
proteinogenic or nomproteinogenic amino acid (preferred), purine or
pyrimidine base, nucleoside, nucleotide, lipid, saturated or unsaturated
c pyrimidine base, nucleoside, nucleotide, lipid, saturated or unsaturated
c pyrimidine base, nucleoside, nucleotide, lipid, saturated or unsaturated
c pyrimidine base, nucleoside, nucleotide, lipid, saturated or unsaturated
c pyrimidine base, nucleoside, nucleotide, lipid, saturated or unsaturated
c polyketide or enzyme. The amino acids produced can be lysine, glutamine,
c glutamate, alanine, leucine, isoleucine, serine, threonine, histidine,
c tyrosine, phenylalanine, or tryptophan. The fine chemical production can
be modulated. The presence or activity of Corynebacterium diphtheriae.
c for diagnosing the presence or activity of Corynebacterium diphtheriae.
c for genetically engineered Corynebacterium or Brevibacterium. The HA
c proteins encoded by the (1) are used to maintain homeostasis in C.
c proteins encoded by the microorganism to adapt to different environmental

The present invention is related to a Lactococcus lactis nucleotide sequence (ABA90521) and related proteins (ABB53300-ABB55621). The nucleic acid sequence is useful in the detection and/or amplification of nucleic acid sequence, particularly to identify Lactococcus lactis or related species. The proteins of the invention are useful for the biosynthesis or biodegradation of a composition of interest. The invention helps research in lactic bacteria, particularly useful in the production of yogurt and cheese. Note: The sequence data for this patent is based on equivalent patent WO200177334 (published 18-OCT-2001) which is available in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences. (Updated on 29-AUG-2003 to standardise OS field)

C;Function: <GEN>
A;Gene: this protein pathway
A;Note: this protein participates indirectly in activation of glutamine synthase activit A;Note: under nitrogen-limiting conditions it is covalently uridylylated; in nitrogen extransferase / uridylyl-removing enzyme which is regulated by the glutamine/alpha-ketoglu
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       A;Gene: glnB

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           C;Function: <NTRB>
A;Description: <NTRB>
A;Description: de-uridylylated P-II forms a complex with nitrogen regulation the uridylylated form of P-II forms a complex with ntrB; free ntrB phosphory A;Note: phosphorylated nitrogen regulation protein I (ntrC) activates transcrC;Function: <ATR>
A;Description: uridylylated P-II forms a complex with adenylyltransferase; thy ylyltransferase deadenylylates glutamine synthase
A;Note: free glutamine synthase is active; adenylylated glutamine synthase is C;Superfamily: regulatory protein P-II
C;Keywords: phosphoprotein; signal transduction
F;Si/Binding site: UMP (Tyr) (covalent) #status experimental

G85900
kypothetical protein glnB [imported] - Escherichia coli (strain O157:H7, substrain ED193)
C,Species: Escherichia coli
C,Species: Escherichia coli
C,Bate: 16-Feb-2001 #sequence_revision 16-Feb-2001 #text_change 14-Sep-2001
C,Accession: G85900
R;Perna, N.T.; Plunkett III, G.; Burland, V.; Mau, B.; Glasner, J.D.; Rose, D.J.; Mayhemiler, L.; Grotbeck, E.J.; Davis, N.W.; Lim, A.; Dimalanta, E.; Potamousis, K.; Apodaca, Nature 409, 529-533, 2001
A;Title: Genome sequence of enterohemorrhagic Bscherichia coli O157:H7.
A;Reference number: A85480; MUD:21074935; PMID:11206551
A;Accession: G85900
A;Status: preliminary
A;Molecule type: DNA
A;Residues: 1-112 STDA
A;Residues: 1-12 STDA
A;Residues: 1-12 STDA
A;Residues: 1-12 STDA
A;Reperimental source: strain O157:H7, substrain EDL933
C;Genetics:
A;Gene: GlnB
C;Superfamily: regulatory protein P-II
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              :s

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Liotenberg S., Castets A.M., Campbell D., Houmard J.,
Tandeau de Marsac N.;
Submitted (APR-1996) to the EMBL/GenBank/DDBJ databases.

-!- FUNCTION: P-II INDIRECTLY CONTROLS THE TRANSCRIPTION OF THE GS
GENE (GLNA). P-II PREVENTS NR-II CATALYZED CONVERSION OF NR-I
GENE (GLNA). P-II PREVENTS NR-II CATALYZED CONVERSION OF HEN P-II
IS PHOSPHORYLATED, THESE EVENTS ARE REVERSED (BY SIMILARITY).

-!- FUNCTION: IN NITROGEN-LIMITING CONDITIONS, WHEN THE RATIO OF GLN
TO 2-KETOGLUTARATE DECREASES, P-II IS PHOSPHORYLATED WHICH ALLOWS
THE DEADENYLYLATION OF GLUTAMINE SYNTHETASE (GS), THUS ACTIVATING
THE ENZYME (BY SIMILARITY).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          are no restrictions on

-!- FUNCTION: P-II INDIRECTLY CONTROLS THE TRANSCRIPTION OF THE G. GENE (GLNA). P-II PREVENTS NR-II CATALYZED CONVERSION OF NR-I NR-I-PHOSPHATE, THE TRANSCRIPTIONAL ACTIVATOR OF GLNA. WHEN PIS PHOSPHORYLATED, THESE EVENTS ARE REVERSED.

-!- FUNCTION: IN NITROGEN-LIMITING CONDITIONS, WHEN THE RATIO OF TO 2-KETOGLUTARATE DECREASES, P-II IS PHOSPHORYLATED WHICH ALL THE DEADENYLYLATION OF GLUTAMINE SYNTHETASE (GS), THUS ACTIVATINE ENZYME.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       PHCSPHORYLATION.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Enterobacteriales
        P-II-UMP ALLOWS THE DEADENYLYLATION OF GLUTAMINE SYNTHETASE THUS ACTIVATING THE ENZYME. CONVERSERLY, IN NITROGEN EXCESS IS DEURIDYLATED AND PROMOTES THE ADENYLATION OF GS.

FUNCTION: P-II INDIRECTLY CONTROLS THE TRANSCRIPTION OF THE GENE (GLNA). P-II PREVENTS NR-II CATALYZED CONVERSION OF NR-I-PHOSPHATE, THE TRANSCRIPTIONAL ACTIVATOR OF GLNA. WHEN IS URIDYLYLATED TO P-II-UMP, THESE EVENTS ARE REVERSED.

SUBUNIT: Homotrimer (By similarity).

SIMILARITY: Belongs to the P(II) protein family.
                                                                                                                                                                                                                   for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        111

Holtentification of the Klebsiella pneumoniae glnB gene: nuclectide sequence of wild-type and mutant alleles.";
Mol. Gen. Genet. 215:134-138(1988).

-!- FUNCTION: IN NITROGEN-LIMITING CONDITIONS, WHEN THE RATIO OF GLNN TO 2-KETOGLUTARATE DECREASES, P-II IS URIDYLYLATED TO P-II-UMP.

P-II-UMP ALLOWS THE DEADENYLYLATION OF GLUTAMINE SYNTHETASE (GS), THUS ACTIVATING THE ENZYME. CONVERSERLY, IN NITROGEN EXCESS P-II IS DEURIDYLATED AND PROMOTES THE ADENYLATION OF GS.

-!- FUNCTION: P-II INDIRECTLY CONTROLS THE TRANSCRIPTION OF THE GENE (GLNA). P-II PREVENTS NR-II CATALYZED CONVERSION OF NR-I TO NR-I-PHOSPHATE, THE TRANSCRIPTIONAL ACTIVATOR OF GLNA. WHEN P-II

Plant Mol. Biol. Rep. 13:333-335(1995).
-!- FUNCTION: P-II INDIRECTLY CONTROLS THE TRANSCRIPTION OF THE GLUTAMINE SYNTHETASE GENE (GLNA). P-II PREVENTS NR-II CATALYZED CONVERSION OF NR-I TO NR-I-PHOSPHATE, THE TRANSCRIPTIONAL ACTIVATOR OF GLNA. WHEN P-II IS URIDYLYLATED TO P-II-UMP, THESE EVENTS ARE REVERSED. WHEN THE RATIO OF GLN TO 2-KETOGLUTARATE DECREASES, P-II IS URIDYLYLATED TO P-II-UMP, WHICH CAUSES THE DEADENYLYLATION OF GLUTAMINE SYNTHETASE, SO ACTIVATING THE ENZYME (BY SIMILARITY).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Porphyra

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               STRAIN=ATCC 11170 / S1;

STRAIN=ATCC 11170 / S1;

Zhang Y., Ludden P.W., Roberts G.P.;

Submitted (OCT-1997) to the EMBL/GenBank/DDBJ databases.

-!- FUNCTION: P-II INDIRECTLY CONTROLS THE TRANSCRIPTION OF THE GLUTAMINE SYNTHETASE GENE (GLNA). P-II PREVENTS NR-II CATALYZED CONVERSION OF NR-I TO NR-I-PHOSPHATE, THE TRANSCRIPTIONAL ACTIVATOR OF GLNA. WHEN P-II IS URIDYLYLATED TO P-II-UMP, THESE EVENTS ARE REVERSED. WHEN THE RATIO OF GLN TO 2-KETOGLUTARATE DECREASES, P-II IS URIDYLYLATED TO P-II-UMP, WHICH CAUSES THE DECREASES, P-II IS URIDYLYLATED TO P-II-UMP, WHICH CAUSES THE DEADENYLYLATION OF GLUTAMINE SYNTHETASE, SO ACTIVATING THE BNZYN-I-SUBUNIT: Homotrimer (By similarity).

-!- SUBUNIT: Homotrimer (By similarity).

"Nucleotide sequence and characterization of the Rhodobacter
sphaeroides glnB and glnA genes.";
Microbiology 140:2143-2151{1994}.

-!- FUNCTION: P-II INDIRECTLY CONTROLS THE TRANSCRIPTION OF THE
GLUTAMINE SYNTHETASE GENE (GLNA). P-II PREVENTS MR-II CATALYZED
CONVERSION OF NR-I TO NR-I-PHOSPHATE, THE TRANSCRIPTIONAL
ACTIVATOR OF GLNA. WHEN P-II IS URIDYLYLATED TO P-II-UMP, WHICH CAUSES THE
DECREASES, P-II IS URIDYLYLATED TO P-II-UMP, WHICH CAUSES THE
DEADENYLYLATION OF GLUTAMINE SYNTHETASE, SO ACTIVATING THE ENZYME.
-!- SUBUNIT: Homotrimer (By similarity).
-!- SUBUNIT: Belongs to the P(II) protein family.
                                                                                                                                                                                                                                         SEDKFVAKVKM

C -: FUNCTION: IN NITROGEN-LIMITING CONDITIONS, WHEN THE RATIO OF GLN

C -: FUNCTION: IN NITROGEN-LIMITING CONDITIONS, THE RATIO OF GS.,

THUS ACTIVATING THE ENZYME. CONVERSERLY, IN NITROGEN EXCESS P-II

IS DEURIDYLATED AND PROMOTES THE ADENYLATION OF GS.

C -: FUNCTION: P-II INDIRECTLY CONTROLS THE TRANSCRIPTION OF THE GS

GENE (GLNA). P-II PREVENTS NR-II CATALYZED CONVERSION OF NR-I TO

NR-I-PHOSPHATE, THE TRANSCRIPTIONAL ACTIVATOR OF GLNA. WHEN P-II

IS URIDYLATED TO P-II-UMP, THESE EVENTS ARE REVERSED.

C -: SUBUNIT: Homotrimer (By similarity).

C -:- SUBUNIT: Belongs to the P(II) protein family.

```

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

AAF58584. WPI; 2001-158572/16 N-PSDB; AAF58582, A Novel P-PII genes capable of regulating plant nitrogen assimilation, useful for transgenic plant production, and as probes for isolating additional genomic clones having P-PII gene promoters.

Claim 1; Fig 1; 35pp; English.

The present sequence is encoded by a nitrogen regulatory PII gene. Movel plant PII (also called P-PII) nucleotide sequences have been isolated. They are useful for regulating nitrogen assimilation in plants, and in transgenic plant production. They are also used to engineer organisms that overexpress wild-type or mutant P-PII regulatory proteins. P-PII proteins are useful for in vitro screening of herbicides. P-PII nucleotides may be used as probes for isolating additional genomic clones with the promoters of P-PII genes. P-PII promoters are light- and/or sucrose-inducible, and are suitable for genetic engineering of plants

                    ö
                                                                                                                                                                                                                                                                                                                                                                                                                                      The present sequence is encoded by a nitrogen regulatory PII gene. Novel plant PII (also called P-PII) nucleotide sequences have been isolated. They are useful for regulating nitrogen assimilation in plants, and in transgenic plant production. They are also used to engineer organisms that overexpress wild-type or mutant P-PII regulatory proteins. P-PII proteins are useful for in vitro screening of herbicides. P-PII nucleotides may be used as probes for isolating additional genomic clones with the promoters of P-PII genes. P-PII promoters are light- and/or sucrose-inducible, and are suitable for genetic engineering of plants
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 9

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present sequence is encoded by a nitrogen regulatory PII gene. Noveplant PII (also called P-PII) nucleotide sequences have been isolated. They are useful for regulating nitrogen assimilation in plants, and in transgenic plant production. They are also used to engineer organisms that overexpress wild-type or mutant P-PII regulatory proteins. P-PII proteins are useful for in vitro screening of herbicides. P-PII nucleotides may be used as probes for isolating additional genomic clorwith the promoters of P-PII genes. P-PII promoters are light- and/or sucrose-inducible, and are suitable for genetic engineering of plants
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   3 KVEAILRPWRVSQVSSALLKIGIRGVTVSDVRGFGAQGGSTERQGGSBFSEDKFVAKVKW
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps

gene. Novel
isolated.
                                                                                                          The present sequence is encoded by a nitrogen regulatory PII gene. Nove plant PII (also called P-PII) nucleotide sequences have been isolated. They are useful for regulating nitrogen assimilation in plants, and in transgenic plant production. They are also used to engineer organisms that overexpress wild-type or mutant P-PII regulatory proteins. P-PII proteins are useful for in vitro screening of herbicides. P-PII nucleotides may be used as probes for isolating additional genomic clorwith the promoters of P-PII genes. P-PII promoters are light- and/or sucrose-inducible, and are suitable for genetic engineering of plants. (Updated on 11-SEP-2003 to standardise OS field)
